4.7 Load Sensing

Load-sensing control and working principle

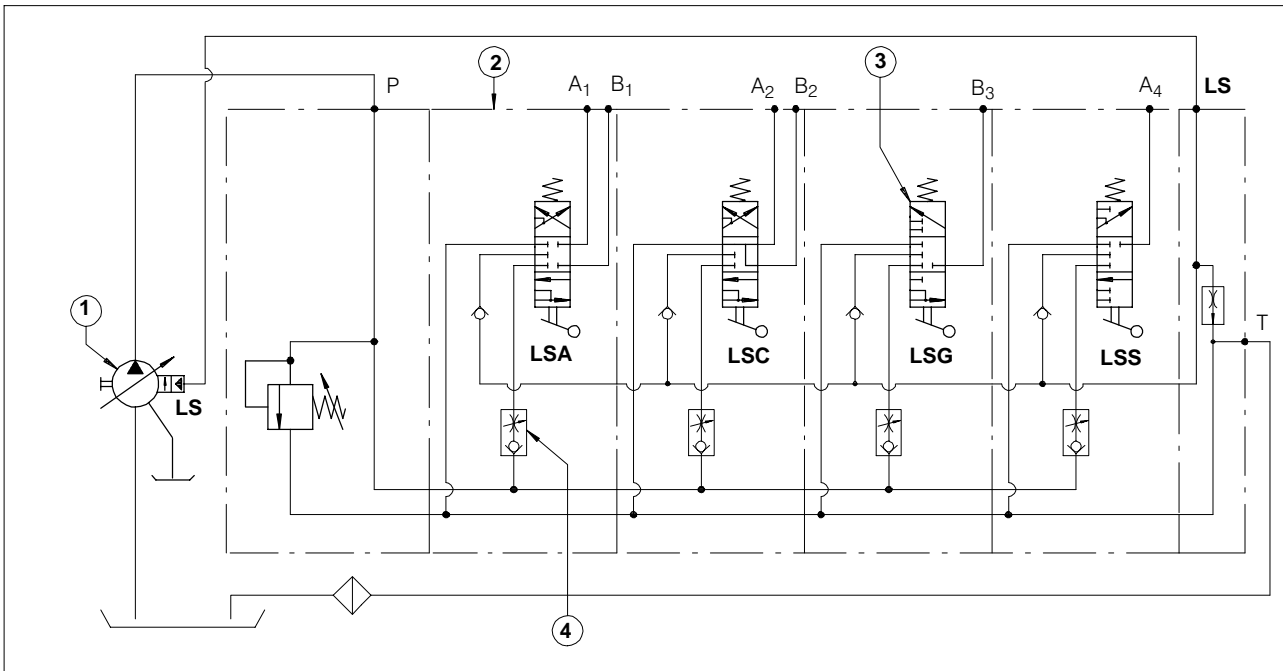

Through the use of variable flow pumps provided with a pressure and flow compensator the pressure and flow parameters can be adapted according to the different and real working conditions.

These pumps require the use of special valves provided with Load Sensing control which “feels” the hydraulic components (cylinder and motor) requirements and through a special pilot line (L.S.) controls the pump compensator conforming capacity and pressure to such requirements which can be variable in time within the limits of the pump performance.

The Load Sensing brings following advantages:

- a) Energy saving.
- b) Smaller heat exchangers can be used due to a smaller heat energy dissipation.
- c) Longer life of the pump and driving motor, due to reduced heavy working cycles.
- d) Excellent control of the load by using 100% of the spool metering.

The L.s. option requires specific bodies and spools. Please ask to Bucher Hydraulics S.p.A. for their availability

- 1) Variable flow pump provided with pressure and flow compensator.
- 2) Load Sensing valve.

- 3) Special spools: LSA – LSC – LSG – LSS
- 4) Check valve provided with max flow control
